reportB / Rodolfo Sierra-Trujillo

Issued: Nov 12, 2026, 3:31 PM Pacific

Record: FORM-4C270CD33A0AC54D23AD66CA

Personal public verification code: VIEW-E271AFC6D0D551F310A7C58D

Include your own public code with every assignment, even in a team folder. Never submit your private recovery key.

SHA-256: c3f48f45218da0ff374a008f7b0e835ce341f8e61b2477eaf77e7ade65364053

Verify the record number at courses.addp2p.com/development-road/independence/index.html?view=verify

An issued record preserves submitted information. It is not a grade or proof of comprehension.

What did you personally execute? Connect completed tasks to files/commits.

I learned that the game development pipeline helps me stay organized while creating my own game. I worked on setting up my Unity project and organizing my scenes, scripts, materials, and prefabs. I also learned how documentation helps me keep track of my progress and plan what I want to add next. My goal is to use what I learned from the six videos to continue building my 3D game and make it more original. One thing I want to learn more about is how to add new gameplay features using C#.

Record setup/import checks, project opens/runs, player configuration/result, and one failure fix retest. Separate observed results from predictions.

For Video 6, I worked on importing a custom 3D character into my Unity project. I learned how to organize character assets, configure a Humanoid rig, and replace the default player model. I also learned how prefabs work and why they are useful. I am testing my character to make sure the model, animations, and movement work correctly. If I encounter any errors, I will use the Unity Console to find the problem, make changes, and test again. My Unity project files will be my evidence of the work I completed.

Personal GitHub URL/commit, team link if used, project/source paths, PDFs, boards/images, credits and reproduction instructions.

I organized my Unity project so that my files are easier to find and open. My project includes folders for scenes, scripts, materials, and prefabs. I am following the six game development videos, and I am currently working on Video 6, which focuses on importing a custom player into Unity. My personal GitHub repository is https://github.com/rsierratrujillo4553-byte/cs110-week12. I am working individually, so I do not have a team link. To open my project, download the Unity project files, open Unity Hub, select Add Project, and choose the project folder. Once the project opens, load the main scene and press Play to test it. I am using my saved project files and GitHub repository as evidence of my progress.

Compare the result with the mission. What did you verify, what remains, and what should the team do next?

While working on my Unity project, I learned how important it is to organize my files and understand how the game development pipeline works. I created a 3D Unity project and organized my scenes, scripts, materials, and prefabs. I also learned how to import custom characters and set up their rigs and materials from Video 6. My saved project files show the work I have completed so far. I am still working on making sure my custom character and its animations work correctly. My next step is to finish testing the player, fix any errors I find, and continue adding features to make the game my own. One useful thing I discovered is that using prefabs can save time because I can reuse objects instead of creating everything from scratch.

Issued team form

FORM-51426BF1736A124E5873680F

Whiteboard

This whiteboard shows the steps I followed while working on my Unity game for Week 12. I started by setting up my 3D project and organizing my scenes, scripts, materials, and prefabs. I am currently following Video 6, which teaches how to import a custom player and configure the character. My next step is to test the character's movement and animations, fix any problems, and test again. I am working individually, and this process helps me understand how to build and improve my game step by step.

Execution / result

I organized my Unity project files and folders to make everything easier to find and manage. I created a TeamFolder with separate folders for scripts, scenes, materials, and prefabs. As evidence, my project includes Main.unity, Player.prefab, and C# scripts for movement, rotation, and color changes. The result is an organized project structure that I can use to continue developing my 3D game. I also learned how important documentation and file organization are in the game development pipeline.

mission

Since I am working solo, I decided that my mission will be to create a simple 3D space shooter game using Unity and C#. The story will be about a spaceship pilot who has to survive waves of enemy ships while traveling through space. My main playable goal is to let the player control a spaceship, move around the screen, and shoot at enemies to earn points. I want to start with basic movement and shooting before adding more features. I will use Visual Studio to write my C# scripts and GitHub to save and track my progress. My goal is to create a working game that is fun to play while improving my programming and game development skills.

framework

Since I am working solo, I decided to use the ADD (Attribute-Driven Design) framework to guide my decisions while creating my 3D space shooter game in Unity. I chose this framework because it will help me focus on the most important parts of my game before adding more complicated features. My first priority will be creating a 3D spaceship that the player can control and use to shoot enemies. After that, I want to add enemy spaceships, collisions, a health system, and a score system. I will test each feature before moving on to the next one. Using this framework will help me stay organized, improve my C# programming skills, and make sure my game is playable and completed on time.

pipeline

Story goal owner Me (solo) 2026-11-10T12:45 to 2026-11-10T13:00 Pacific

Inputs / assets owner Me (solo) 2026-11-10T13:00 to 2026-11-10T13:30 Pacific

Build + configure owner Me (solo) 2026-11-10T13:30 to 2026-11-10T16:30 Pacific

Output / scene owner Me (solo) 2026-11-10T16:30 to 2026-11-10T17:30 Pacific

Test + handoff owner Me (solo) 2026-11-10T17:30 to 2026-11-10T19:30 Pacific

My production pipeline shows how I plan to create my 3D space shooter game using Unity and C#. Since I am working solo, I will be responsible for every stage of development. My goal is to create a playable game where the player controls a spaceship and shoots enemy ships. I will use Unity, Visual Studio, C#, and 3D models to build my project. My main tasks will be creating spaceship movement, shooting mechanics, enemies, and collisions. After completing these features, I will test the game to make sure everything works correctly. I will also use GitHub to save my progress. This plan will help me stay organized and complete my project one step at a time.

tech

Since I am working solo, I decided to use tools that will help me create my 3D space shooter game and keep everything organized.

1. **Unity (Game Engine):** I chose Unity because it supports 3D game development and gives me the tools to create spaceships, enemies, and environments.

2. **C# (Programming Language):** I chose C# because it works with Unity and allows me to program spaceship movement, shooting, enemy behavior, and collisions.

3. **Visual Studio (Code Editor):** I will use Visual Studio to write my C# scripts, find errors, and improve my code.

4. **Unity Packages:** I plan to use Unity's Input System for player controls and the built-in 3D physics system for detecting collisions.

5. **3D Assets:** I will start with basic 3D shapes for my spaceship and enemies. Later, I can add more detailed models, laser effects, and a space background.

6. **Git and GitHub (Version Control):** I will use Git and GitHub to save my progress, track changes, and make my project accessible to my professor.

Since I am working solo, I will be responsible for checking that all my tools, packages, and assets work correctly. I will test my C# scripts in Unity, check that my 3D models display properly, and make sure my GitHub repository stays updated. I chose these tools because they will help me build a playable 3D game while improving my programming skills.

Time code

Classes & components

Class | Responsibility | GameObject

PlayerController | MonoBehaviour, Rigidbody | Controls spaceship movement

PlayerShooting | MonoBehaviour | Fires laser projectiles

Laser | MonoBehaviour, Collider | Moves lasers and detects hits

EnemyController | MonoBehaviour, Collider | Controls enemy behavior

GameManager | MonoBehaviour | Tracks score and game state

PlayerHealth | MonoBehaviour | Tracks player health and damage

Variables / properties

Name : type | Value / purpose | Used by

moveSpeed | float | Spaceship movement speed

laserSpeed | float | Laser projectile speed

health | int | Player health

score | int | Player's points

damage | int | Damage from lasers

reuse

Since I am working solo on my 3D space shooter game, I want to create things that I can reuse in future game development projects. Some things I can reuse are my C# scripts for player movement, shooting, enemy behavior, health, and scoring. I can also reuse my Unity project structure and some of the 3D models and effects I create. The code and assets I make myself will be my original work, but if I use anything from the Unity Asset Store or other websites, I will make sure to check the license and give credit when required. I will keep track of where my assets come from in my GitHub README, including the creator's name, source link, and license information. This will help me stay organized and make it easier to use my work in future games without having to start everything from scratch.

boardNotes

Since I am working solo, my huddle board shows the decisions I made for my 3D space shooter game. I decided to use Unity as my game engine, C# for programming, Visual Studio for writing my code, and GitHub for keeping track of my progress. My main goal is to create a playable game where the player controls a spaceship, shoots enemies, and earns points. I also decided to use the ADD framework to help me focus on the most important features first.

Since I don't have any teammates, there were no team disagreements. One decision I changed was switching my game from 2D to 3D because I wanted to take advantage of Unity's 3D features and challenge myself.

Some questions I still have are how detailed my 3D models should be, how many enemies I should include, and whether I will have enough time to add extra features like different weapons or levels. For now, I plan to focus on

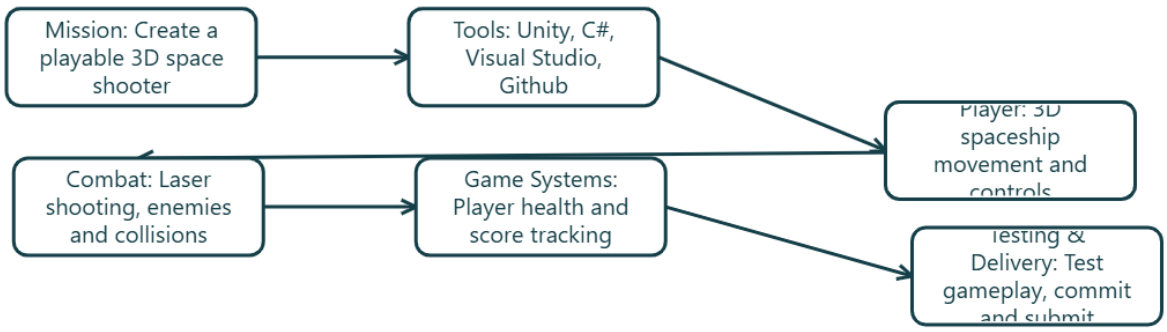

making the basic gameplay work before adding anything more complicated. I will keep my decisions and progress recorded in my GitHub README so I can look back at them while developing my game.

Whiteboard

My huddle board shows my plan for creating a 3D space shooter game in Unity. Since I am working solo, I am responsible for every part of the project. My mission is to create a playable game where the player controls a spaceship, shoots enemy ships, and earns points.

I will use Unity for the game engine, C# for programming, Visual Studio for writing my scripts, and GitHub to track my progress. I will start by creating the spaceship and its movement controls. After that, I will work on shooting, enemies, collisions, health, and scoring. I will test each feature before moving on to the next one.

My main priority is to make sure the basic gameplay works before adding extra features. I will record important decisions in my GitHub README and use commits to show my progress. Since I am working solo, there are no team disagreements, but I will review my decisions and make changes when needed.

SOLO PROJECT

Whiteboard

My production pipeline shows how I plan to create my 3D space shooter game using Unity and C#. Since I am working solo, I will be responsible for every stage of development. My goal is to create a playable game where the player controls a spaceship and shoots enemy ships. I will use Unity, Visual Studio, C#, and 3D models to build my project. My main tasks will be creating spaceship movement, shooting mechanics, enemies, and collisions. After completing these features, I will test the game to make sure everything works correctly. I will also use GitHub to save my progress. This plan will help me stay organized and complete my project one step at a time.

notes

Since I am working solo, I am responsible for completing all the tasks myself. My goal is still to create a simple 3D space shooter using Unity and C#. I need to focus on completing the tutorials through Video Six before adding more features to my game. I also need to make sure my spaceship movement and shooting work correctly. If I run into any problems with Unity or my C# scripts, I will troubleshoot them before moving forward. Once I finish, I will test my project, save my progress to GitHub, and make sure my report and submission requirements are completed.

recap

I understand that my goal is to create a simple 3D space shooter using Unity and C#. Since I am working solo, I will be responsible for building the game, writing the code, testing everything, and keeping track of my progress on GitHub. My job is to follow the Unity tutorials through Video Six and use what I learn to start building my game. I want to focus on getting the spaceship to move and shoot before adding enemies, points, and other features. I still need to clarify how to make the shooting system work in 3D and how to set up enemy movement. I also need to make sure I understand how to test my game and submit my report, GitHub link, and public VIEW code correctly.
